

Good afternoon, Iain. Report January 11 2024.

Attached your 2nd set of results for the river samples.

Improved logistics meant the samples were delivered in time and the samples deviation assessment was met (N) meaning no deviations.

Samples 1 to 4 and 6 are very high in all bacteria tested for and sample 5 high for Enterococci.

I have attached the bathing waters guidance, if you check the results against the values for inland water ways you will see how the river water compares with the bathing standards.

The values are so high that despite dilutions the results are still reported as greater than the quoted figure however at these levels we know that the water fails bathing water standard and would be deemed unsuitable for bathing in (read unsafe)

I have not yet received the Ph results which I will forward as soon as they are received.

If you wish to discuss further, you can contact me on my mobile number below.
